PROFESSIONAL EXPERIENCE

WALMART

Software Engineer III

Sunnyvale, CA

Aug 2024 - Feb 2026

- Owned Android Cart and Checkout flows on high-traffic purchase paths serving millions of daily active users, modeling UI state to survive process death, configuration changes, background execution limits, and low-memory conditions without corrupting cart or payment state.
- Shipped new checkout features through fast iterations, modeling durable transaction state separately from transient UI events to prevent duplicate charges, lost cart data, and inconsistent pricing during lifecycle recreation and task re-launch.
- Implemented lifecycle-safe navigation using ViewModel-scoped state and explicit UI state machines, eliminating side effects caused by Fragment reattachment and back-stack restoration.
- Integrated GraphQL backend APIs into checkout, shaping queries to minimize payload size, stabilize pagination, and tolerate partial backend failures without breaking client-side state.
- Applied structured concurrency with Kotlin Coroutines and StateFlow to coordinate asynchronous cart, pricing, and payment updates, preventing race conditions and inconsistent UI state.
- Drove performance optimization by profiling cart and checkout with the Android Studio Profiler and memory analysis, cutting dropped frames and improving UI responsiveness on low-memory devices.
- Collaborated cross-functionally with design and product to turn designs into quality features that scale; wrote ViewModel and UI tests in Kotlin (TDD) covering state transitions and lifecycle edge cases, integrated into CI.

CVS HEALTH

Android Developer

Arlington, VA

Aug 2023 - Jul 2024

- Owned Android Prescription Refill and Order Placement flows, modeling UI state to survive process death, configuration changes, background execution limits, and low-memory conditions without duplicating refill requests or corrupting order state.
- Modeled durable order state separately from transient UI events, preventing duplicate submissions, inconsistent refill status, and payment mismatches during lifecycle recreation and task re-launch scenarios.
- Implemented lifecycle-safe navigation and state restoration using ViewModel-scoped state, eliminating side effects from Fragment reattachment and interrupted background execution.
- Integrated REST backend APIs for eligibility, pricing, insurance validation, and order confirmation, validating response schemas and error contracts to prevent client-side corruption under latency or partial failures.
- Implemented Android authentication using OAuth 2.0 and JWT, storing tokens in EncryptedSharedPreferences and handling refresh and expiration to keep user sessions secure.
- Structured features into clean data, domain, and presentation layers with dependency injection, improving testability and reducing coupling across flows.
- Optimized RecyclerView and screen rendering for prescription lists and order summaries by stabilizing item IDs and minimizing layout invalidations, delivering smoother scrolling and faster UI response.

COGNIZANT TECHNOLOGY SOLUTIONS

Java Developer

Hyderabad, India

Jun 2019 - Aug 2021

- Implemented Java services with Spring Boot and added authentication and authorization via Spring Security, improving system reliability and reducing error rates in healthcare applications.
- Designed and implemented a continuous-integration pipeline using Maven and Jenkins, improving software quality and consistency.
- Deployed Java microservices in Docker containers orchestrated by Kubernetes for faster rollout and higher availability, automating build, test, and delivery.
- Integrated Apache Kafka for event-driven architectures, enabling real-time data streaming across microservices.
- Analyzed database performance and implemented indexing strategies, reducing database latency by 20%.

PROJECTS

- Transaction-Safe Android Checkout System:** Built a lifecycle-safe Android checkout flow in Kotlin using state-driven MVVM to handle process death, background execution limits, and idempotent backend interactions without duplicate submissions.
- Low-Latency Adaptive Video Streaming Engine:** Implemented an Android video player using ExoPlayer with HLS/DASH, tuning MediaCodec decoding, buffering, and adaptive-bitrate logic to reduce startup latency and rebuffering under unstable networks.
- Full Stack Web Application - "Yummy" Recipe Platform:** Developed a recipe discovery and sharing site with a responsive front-end (HTML, CSS, Bootstrap, JavaScript, jQuery) backed by Oracle DB. mason.gmu.edu/~spore2/Yummy

SKILLS

Programming Languages: Java, Kotlin, C, C#, C++, Go

Android & Jetpack: Activities, Fragments, Jetpack Compose, ViewModel, LiveData/StateFlow, Room, DataStore, WorkManager, MVVM, MVI, state-driven UI, Lifecycle-aware Architecture, ExoPlayer

Networking & APIs: REST, Apollo GraphQL, Retrofit, OkHttp, JSON, pagination, partial-failure handling

Testing & Performance: JUnit, Espresso, Mockito, UI/instrumentation testing, TDD, Android Profiler, Memory Analysis, Jank diagnosis

Security & Auth: OAuth 2.0, JWT, EncryptedSharedPreferences, Spring Security

Backend, Messaging & DevOps: Spring Boot, Microservices, Apache Kafka, Redis, RTSP/WebRTC, Docker, Kubernetes, Maven, Jenkins, CI/CD, Agile, Scrum, database indexing & query optimization

CERTIFICATIONS

- Google Generative AI; GCP - Professional Machine Learning Engineer; AWS Cloud Practitioner; HackerRank - Data Structures (Advanced), Problem Solving (Advanced), Python Programming; Oracle - Java Programming; EPAM - Introduction to Front-end Technology, Database & Testing

EDUCATION

George Mason University | Master of Science, Computer Science

Fairfax, VA, USA
